

THE FUTURE OF LAND TRANSPORTATION

Presenters: Vitalia Flippin, Saige Whitefield, Anastacia Bernal,
Poesy Cruz, Patrick Obrien

Project Details: Middle schoolers explored real-world transportation issues through creative projects that encouraged research, problem-solving, and teamwork. This presentation gave them the chance to practice public speaking and share their innovative ideas. Join us as they showcase what they've learned and imagined for the future of transportation.

The future of transportation

By Vitalia, Saige,
Anastacia, Poesy
and Patrick

Ideas

Economy class – regular-sized house, regular transportation

Middle class – outer space train, swimming pool and hot tub

First class – space cruiser, teleportation room

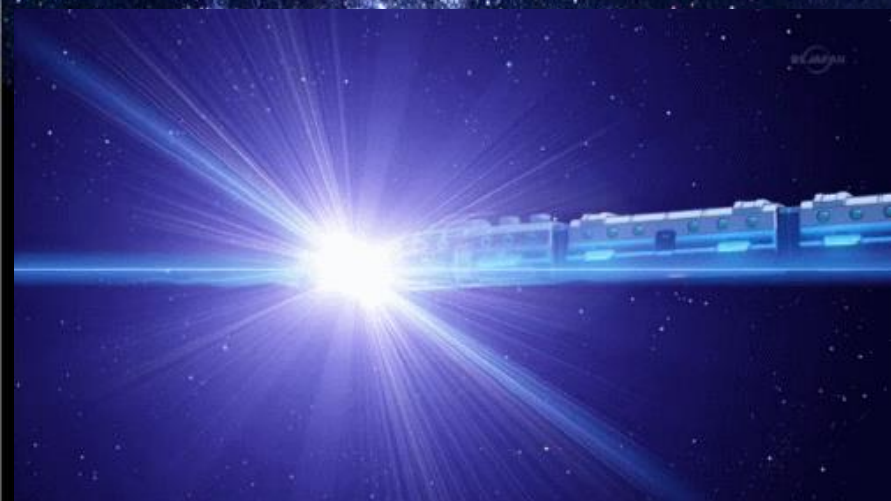

SOME QUESTIONS WE WILL BE ANSWERING

- *What does it mean regular transportation for the economy passengers? *Will it be automobiles, buses, trains or something else?
- *Where will outer space train transfer passengers from the middle class?
- *What space trips will be available for passengers from the first class?
- *What technologies do we need to explore to invent the teleportation room (for example, space technologies, perhaps some advance physics)?

What does it mean regular transportation for the poor class passengers? Will it be automobiles, buses, trains or something else? In this slide we will be explaining just that.

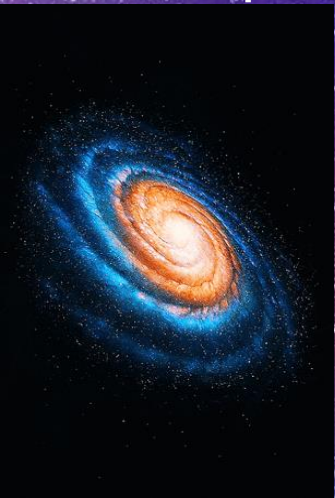

The regular transportation for the poor class is gasoline or electric cars , boats, and trains. It is basically the average transportation for the average person in modern day.

Where will outer space train transfer passengers from the middle class? That is the real question.

The outer space train will transfer people throughout the milky way. These place are mars, the moon, ect. It could also transport you to other galaxies but it would take several years. In these other galaxies we might discover other alien life (like plants or creatures) and would be the first colonists on these planets.

What space trips will be available for passengers from the first class?

We would have a two hour tour on the moon. A tour of the stars that are apart of the Milky Way. Then a luxury hotel on pluto. They will also get a tour of other galaxies and planets. For the tours of the star they will just look at the stars. There will be no contact.

What technologies do we need to explore to invent the teleportation room (for example, space technologies, perhaps some advance physics)?

First we have to have do some advanced physics and go into deep space and find an alien planet take control and steal their tech and research. Then we need to figure out how to use their tech and build our teleportation room. We also combine our tech with theirs.

THANK YOU!

we hope you enjoyed.

MADE IT!

THANK YOU

HAPPY FRIDAY!!
